## Challenge : Flow sensors beyond 600m

Distance limitations for flow sensing back to Irrigation Smart Controllers has always been limited to 600m, due to loss of pulse data from outside interferences such as wiring of motors, lights or signals that cross or pass close by the flow sensor cable. In fact upto 600m, the size of the conductors is less importance than the twisting and shielding because flow sensor signals are more subject to interference than line losses.

Now with CST Isoflow, and CST180 standard shielded cable, flow sensors signals can be boosted upto 2.4km (8000') see below.

For more information including CST180 cable supply, visit our website at [www.creativesensorsinternational.com](http://www.creativesensorsinternational.com)
